

Climatic Constants for Calculating Subsurface Soil Temperatures

The climatic constants below have been generated using the monthly average temperatures from the ASHRAE Weather Data Viewer, Version 6.0 (ASHRAE, 2017), by least squared curve fitting, see Phetteplace et al. (2013b) for the equations and be certain to read the **cautionary note** below. This data set contains 8118 weather stations worldwide, an increase of nearly 50% over the 5564 stations of ASHRAE (2009) that was the source of the previous constants posted here.

The quality of the fit to the analytic equations that use these constants varies with the source of the empirical weather data from ASHRAE (2017). The table below contains the RMS error for each fit computed by comparing the results generated by using the constants in the analytic equations with the monthly average temperatures from the ASHRAE (2017) used to generate these constants. The fit in most cases is quite good with the average RMS error being 1.4 °F (0.8 °C). The fit is much worse of high latitudes i.e., greater than approx. 70° either North or South. The fit is also much worse for a number of stations in Eastern Africa that are at low latitudes, for example Mongolia, Chad, Benin, Kenya, Togo, Ghana, etc.; perhaps due to the length/accuracy of the data record or other climatological factors unknown to the author. Maximum RMS error is 7.1 °F (3.9 °C) and there are, for example, a total of 22 stations where RMS errors exceed 5 °F (2.8 °C). In most cases, however, the results are useful for the purpose of estimating subsurface soil temperatures, especially given the other uncertainties in such estimates owing to factors including the complexity of the energy balance at the Earth's surface and uncertainty in soil thermal properties, see Phetteplace et al. (2013a) for more discussion as well as Phetteplace et. al. (in press).

Country codes as well as state and providence codes can be found at the end of the data.

Cautionary Note: Regretfully there is a typographic error in Phetteplace et al. (2013b), in the calculation of the lag time the argument for the arc tangent should be just $(C2/C1)$ not $(C2/C1) + \pi/2$ as the misplaced parenthesis would indicate. Furthermore, in using these constants in the equations presented in Phetteplace et al. (2013a), Phetteplace et al. (2013b), ASHRAE (2016) and the prior versions of the ASHRAE (2016) Handbook (2000, 2004, 2008, and 2012) there is an additional constant that must be introduced for climates in the Southern Hemisphere. That constant is simply -1 and it is a multiplier on the amplitude constant, A_s . This will be clarified in all future versions of these publications and Phetteplace et. al. (in press).

Credits: The effort to develop this updated set of climatic constants was part of a substantial effort to update the ASHRAE District Cooling Guide (Phetteplace et al., 2013a). That effort was made possible with support from Emirates Central Cooling Systems Corporation (Empower).
